1. Login: “/login”

- Access: <http://localhost:8080/student-management-mvcx/>
 - Redirected to login (AuthFilter)

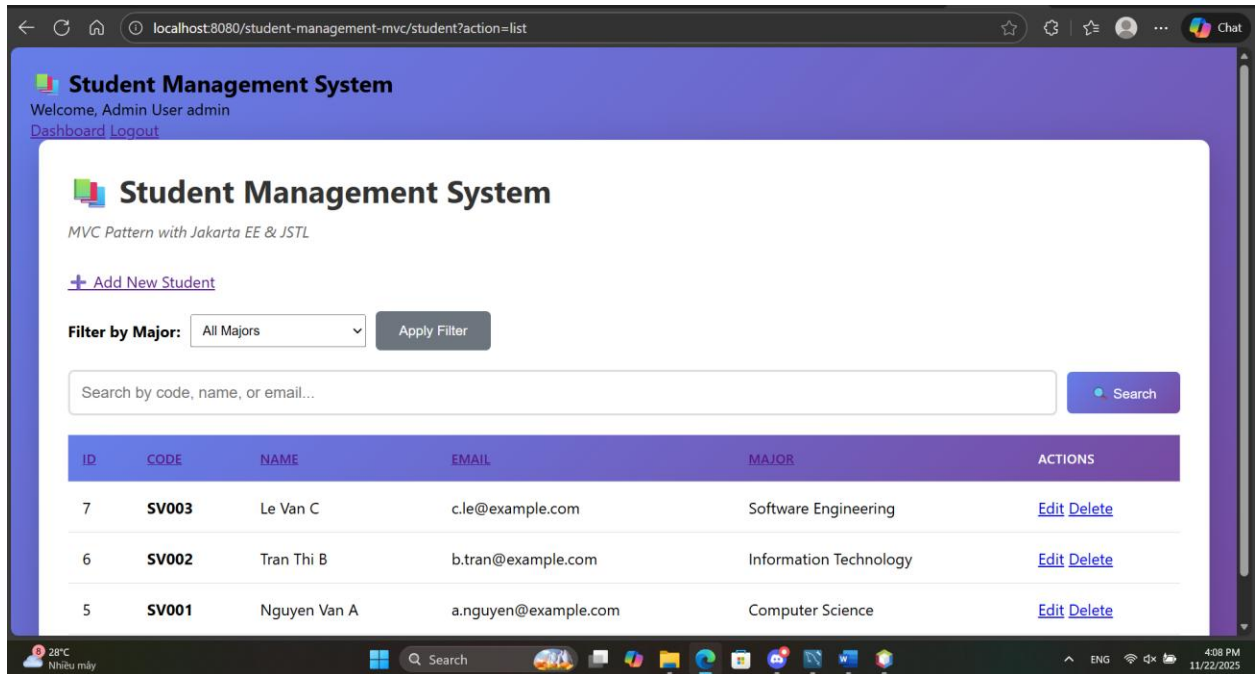

- Explain:
 - User enters the root URL: /
 - AuthFilter intercepts the request first
 - path = "/", and user has no session
 - Filter checks: session == null → user not logged in
 - Filter executes: `response.sendRedirect(contextPath + "/login");`
 - User gets sent to login page.
- Login with: admin / password123
 - Creates session
 - Redirected to dashboard

- Explain:
 - LoginController receives the POST request
 - It loads user from database by username
 - Compares password using BCrypt (stored hash vs input)
 - If valid, redirect to dashboard:
`response.sendRedirect("dashboard");`
 - ➔ Login successful, admin session is now active.

- Click "View All Students"
 - Shows student list
 - Edit/Delete buttons visible (admin)

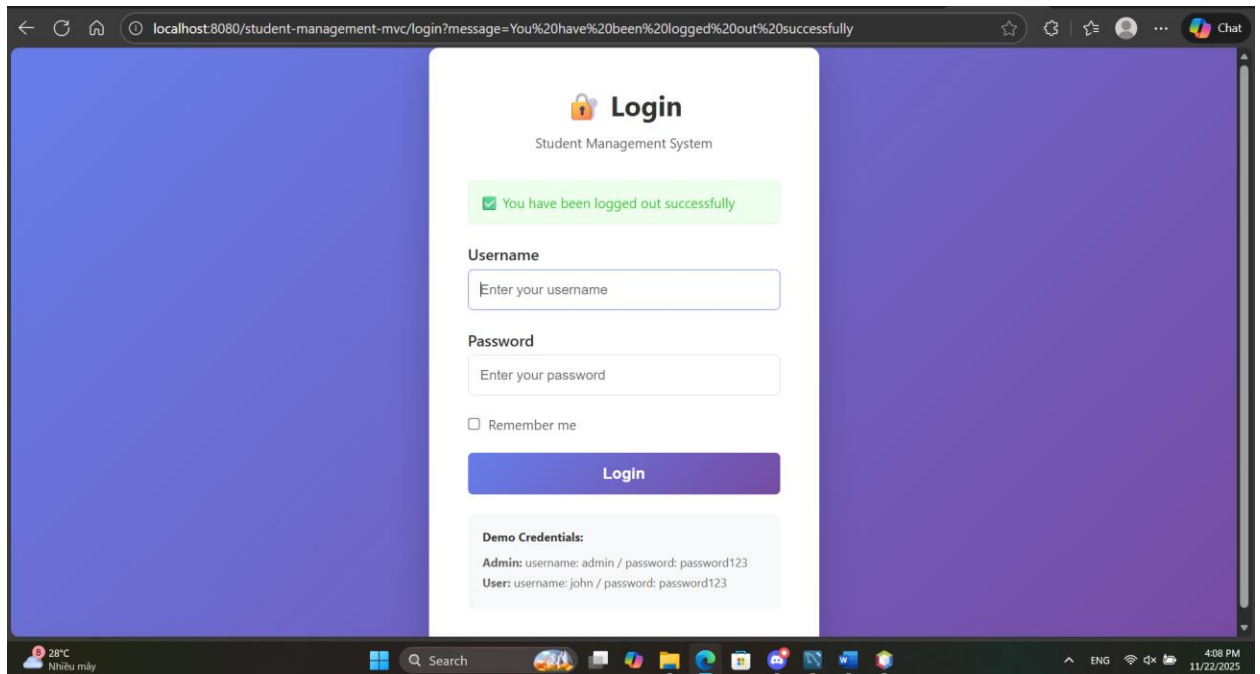

- Explain:
 - user clicks: `/student?action=list`
 - AuthFilter sees user has session → allows access
 - StudentController loads students and forwards to `student-list.jsp`
 - Inside `student-list.jsp`:

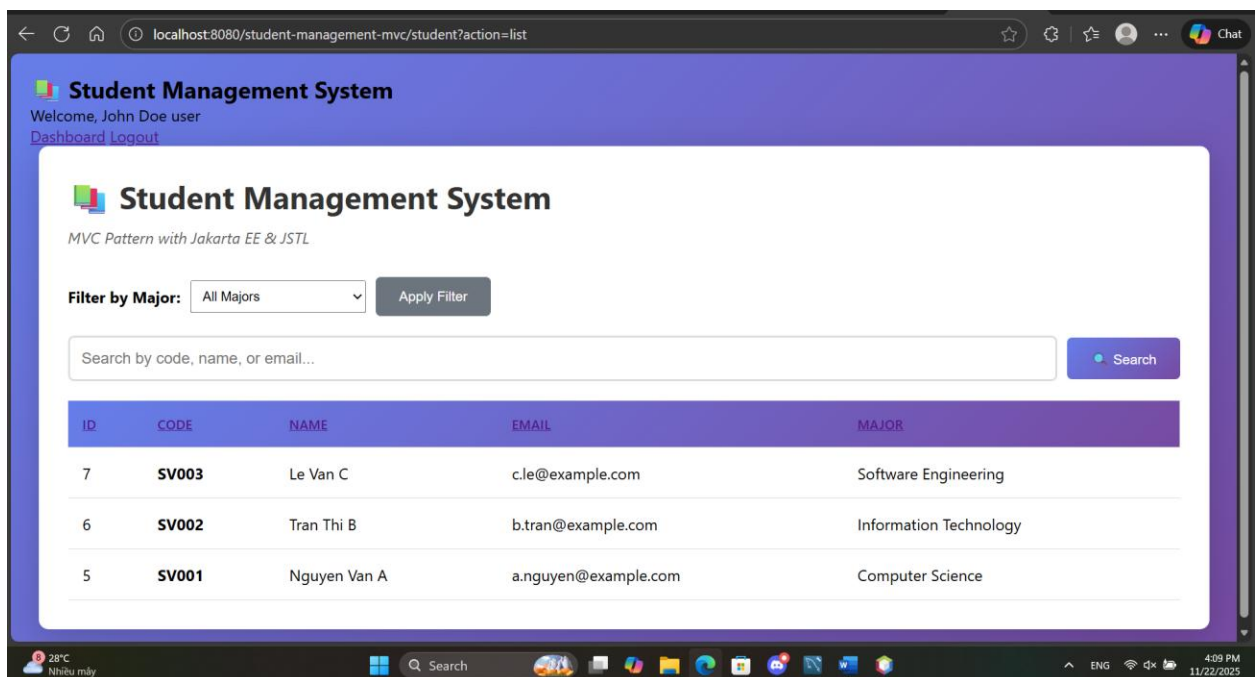

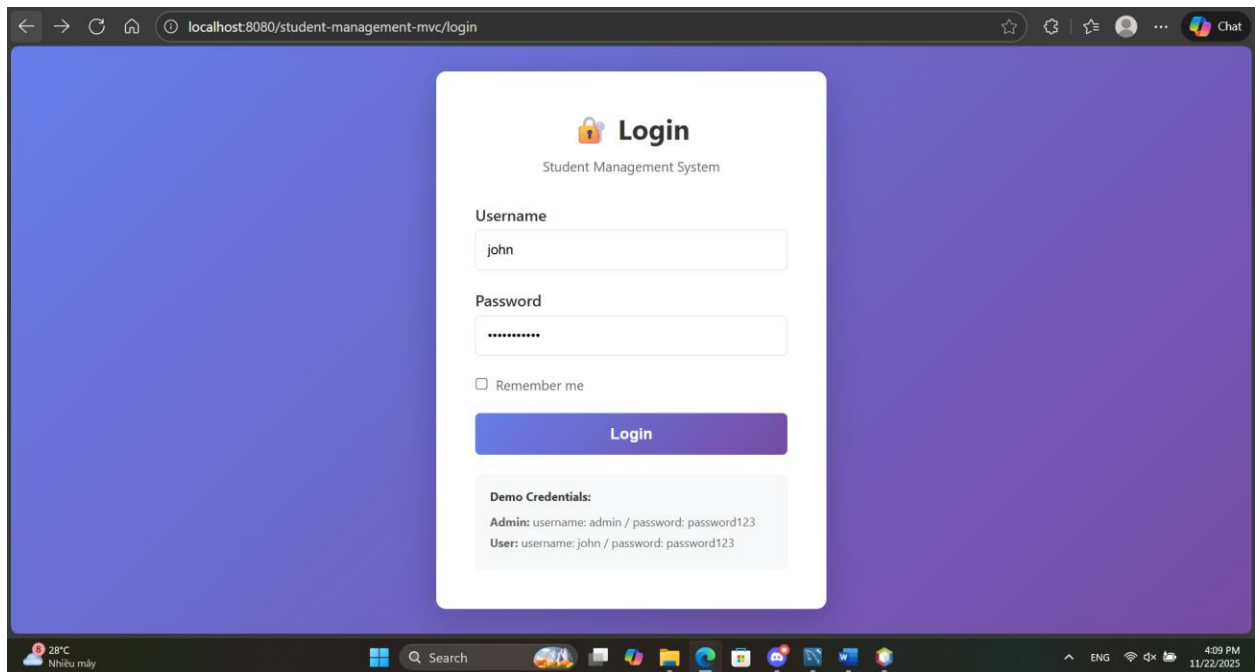

```
<!-- Add New Student Button -->
<c:if test="${sessionScope.role eq 'admin'}">
  <div style="margin: 20px 0;">
    <a href="student?action=new" class="btn-add">+ Add New Student</a>
  </div>
</c:if>
```

- ➔ Admin sees management buttons.
- ➔ Regular user would NOT see those buttons because `role != admin`.

- Logout
 - Session invalidated
 - Redirected to login

- Explain:
 - user clicks /logout
 - LogoutController runs:
 - `request.getSession().invalidate();`
 - `response.sendRedirect("login");`
 - AuthFilter now sees: `session == null`
 - ➔ User is no longer authenticated
 - ➔ All future requests redirect to login again
- Login with: john / password123
 - Regular user view
 - No Edit/Delete buttons

- Explain:
LoginController does the same as before
But this user has: role = "user"
After login, JSP pages hide admin features:

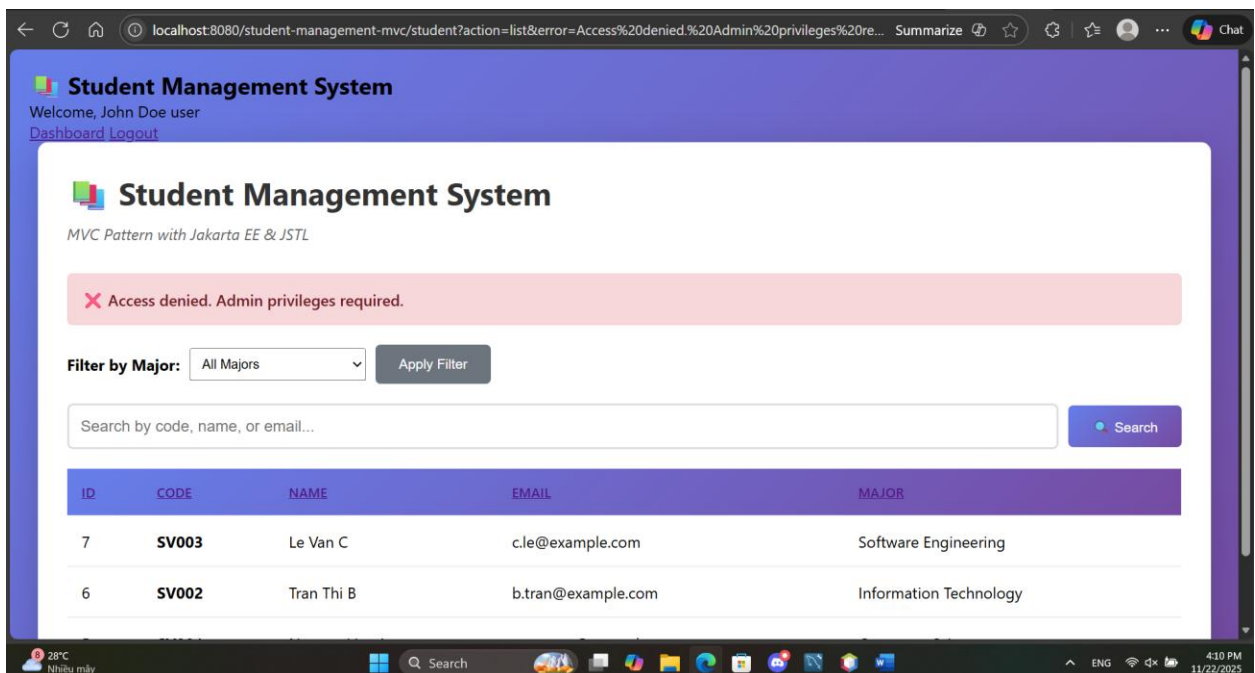

```

<!-- Add New Student Button -->
<c:if test="${sessionScope.role eq 'admin'}">
  <div style="margin: 20px 0;">
    <a href="student?action=new" class="btn-add">+ Add New Student</a>
  </div>
</c:if>

```

- ➔ User can view students but cannot manage them
- ➔ System behaves differently based on role (admin or user)

- Try to access: /student?action=new
 - AdminFilter blocks access
 - Error message displayed

- Explain:
 - The request is intercepted by AuthFilter (user is logged in ➔ allowed to proceed) and AdminFilter (checks if role is admin or not, if yes then continue, otherwise reject access)
 - ➔ Normal users cannot manage students, only admins
